

POS & Inventory

Operations manual

TableFlow · BaliFlow CRM — July 2026 edition

Contents

PART 1 — The POS: opening, floor, orders, payments, receipts, closing

PART 2 — Inventory: photo deliveries, automatic stock levels, orders, shrinkage

PART 1 · THE POS

1. What it is and where to find it

The POS (Cassa) is the restaurant's complete till: it takes table orders, sends them to the kitchen/bar, prints pro-forma bills and receipts, settles with any payment method and closes the day with a drawer count.

Open it from the **gold «CASSA» button** pinned at the bottom of the side menu — always visible from any page. It runs on tablets, computers and phones; on the floor a tablet is the usual choice.

2. Opening the day

Before the first receipt, open the till with the opening float (the cash already in the drawer).

- 1 Enter the POS and tap the **Closing** tab.
- 2 Type the **opening float** (e.g. 100.00) and tap **Open till**.
- 3 From then on the day summary updates itself with every payment.

***Tip** The float only matters for the final cash count: forget it one night and the till still works fine.*

3. The floor

The first screen is the table map, grouped by zone. A **light** table is free; a **gold** table has an open bill and shows its running total and minutes elapsed.

Above the tables sit **Counter sale** and **Takeaway** for bills without a table: they stay as chips until settled.

***Note** Tables are managed in Settings → venue tables. Zones (e.g. Terrace, Inside) appear automatically as headings.*

4. Taking the order

Tap a table to enter the order screen: the bill on the left, the menu on the right.

- 1 Search the dish (magnifier) or filter by **category**; tap a dish to add it.
- 2 If the dish has **variants** (e.g. "extra cheese +€1") the picker opens: tick and confirm.
- 3 Pick the **course** (1st, 2nd, 3rd) with the buttons at the top: the kitchen gets lines grouped by course.
- 4 On each line you can change quantity or course, add a **kitchen note** ("no onion") or remove it.
- 5 "**Free item**" adds something off-menu with a hand-typed name and price.
- 6 Tap **Send order**: lines become final and printing starts.

***Station printing** If dishes carry a station (kitchen / bar / pizzeria), each station receives ONLY its own slip: the bar never sees the tagliatelle.*

5. Managing the bill

The bill column holds everything you need during service:

- 1 **Covers**: + and – next to the table name (the cover charge adds itself when configured).
- 2 **Discount**: tap the "Discount" row → percentage or fixed amount.
- 3 **Pro-forma bill**: print the bill to bring to the table, without closing anything.
- 4 **Void line**: the bin on an already-sent line voids it (it stays tracked, the total updates).
- 5 **Move table**: reassign the bill if guests change tables.
- 6 **Cancel bill**: delete a bill opened by mistake (only while unpaid).

6. Getting paid

Tap **Charge** (the green button showing the total).

- 1 Pick the method: **Cash, Card, Meal vouchers, Online, Bank transfer, Other**.
- 2 For cash, type what the guest hands you (or use the 5/10/20/50/100 shortcuts): the **change** is computed instantly.
- 3 **Mixed payment**: settle part with one method (e.g. €30 cash), the rest with another — the button always shows what's left.
- 4 **Even split**: the 2-6 buttons show the per-person share (a calculator aid; the bill stays one).
- 5 On confirm the green screen appears: **receipt number**, change due and **Print receipt**.

***Receipt** Receipts are numbered per year (e.g. No. 27/2026) and break VAT down by rate. With a certified fiscal printer you keep issuing the fiscal receipt as usual; this is the management document.*

7. The receipts journal

The **Receipts** tab lists every receipt of the day: number, time, table, total and payment methods.

- 1 Tap a receipt to open its detail (lines + payments).
- 2 **Reprint** anytime (past days too, via the < > arrows at the top).
- 3 **Void** (owner/manager only, current day only): asks for a reason and keeps the receipt visible, struck through, numbering intact.

8. Closing the till

At the end of service, the **Closing** tab:

- 1 Review the summary: gross takings, receipt count, covers, average receipt, totals per method, discounts and voids.
- 2 Count the drawer and type the **counted cash**: the **difference** vs. expected shows instantly (green when it matches).
- 3 Add a note if needed and tap **Close the day**: the summary is frozen and the till is ready for tomorrow.

Careful If tables are still open, closing warns you: settle or cancel them first.

9. VAT, stations and variants (for the owner)

Everything is configured in the **Menu** page, dish by dish:

VAT: rate per dish (4 / 5 / 10 / 22%). Receipts break VAT out per rate automatically. **Station**: kitchen, bar or pizzeria — decides where the order slip prints. **Variants**: extras with a surcharge (e.g. +€1.00) waiters tick on the fly.

Dishes hidden from the menu (unavailable) disappear from the POS too.

10. Frequently asked questions

Question	Answer
Table ordered in two rounds?	Send multiple orders on the same bill: each send is a numbered order slip.
A last-second espresso?	Add it and tap Charge directly: the order fires automatically before payment.
Wrong dish already sent?	Bin on the line = tracked void. The total updates.
Half card, half cash?	In the payment sheet enter the card amount first, then the rest in cash.
Does it need internet?	Yes, it's a cloud system: with the venue's connection (even a hotspot) it works anywhere.

Question	Answer
Who can void a receipt?	Owner and manager only, stating a reason. Waiters charge bills and void lines.

PART 2 · INVENTORY

1. What it is

Inventory is the restaurant stockroom that (almost) keeps itself: deliveries enter by photographing the delivery note, minimum stock levels are computed from real consumption, supplier orders are prepared in one tap and shrinkage is measured.

Find it in the side menu under **Inventory**. Four key figures at the top: total **Ingredients**, **Low stock**, **Expiring**, **To reorder**.

2. Recording a delivery (photo of the invoice)

When the supplier arrives, nothing is typed by hand:

- 1 Tap **Record delivery** and photograph the delivery note or invoice (or upload the PDF).
- 2 The system reads the lines: products, quantities, prices.
- 3 Check the review screen: each line is matched to an existing ingredient, and new ones create their ingredient automatically.
- 4 Confirm: quantities enter stock and costs update.

***Why it matters** Up-to-date ingredient costs also feed Food Cost and the P&L;: one photo keeps everything aligned.*

3. Automatic minimum stock

Every ingredient has a **minimum stock** (par level). The system computes it from the last 30 days of real consumption, sized to cover ~3 working days.

When new proposals exist, the “Automatic par levels” panel appears: apply them all in one tap or fine-tune them one by one.

***Tip** Let the automation handle daily staples; hand-set only seasonal products.*

4. Reordering from suppliers

When an ingredient drops below its minimum it enters the **reorder list**, grouped by supplier with suggested quantities and an estimated cost.

- 1 Open the “To reorder” panel.
- 2 Review the proposed quantities per supplier.
- 3 Tap **Copy order**: the order text is ready — paste it into the supplier's WhatsApp chat and send.

5. Shrinkage and variances

The **Shrinkage (30 days)** panel compares what left the stockroom with what was sold: the difference is wasted, lost or unrecorded goods, valued in euros.

Check it weekly: if an ingredient “disappears” more than normal, that's where to look.

6. Manual control

Everything stays hand-editable: **New ingredient** to add an item, the pencil to correct stock, fields for cost, supplier and expiry. Ingredients linked to menu dishes deplete automatically with every POS sale.

In short Photo at delivery + POS sales = a stockroom that's always true, orders ready, shrinkage visible.
